

Colour Range – Fluoroplastic Tubing

We manufacture a wide range of tubes produced using a variety of fluoropolymers, fillers and colours. The table below illustrates the standard colours used for our range of fluoroplastic tubing. Our tubing can also be produced as striped tubing. Depending on tube dimensions, we use liquid or dry pigment to colour the tube. Dimensions and choice of raw material affect the transparency and colour appearance of the tube, and variations may occur. Whilst the pigment might strictly be considered as a contaminant, the effect on technical and performance characteristics presented in the data sheet is marginal. Regular tests are performed in order to control and maintain high quality. In addition to our standard range, we can also offer colour, dimensions and length in accordance with customer requirements.
